

## English homework

---

This day was a really special day. A teenager, called George, was walking to school, eager and impatient to see his friends. This boy was really clever and since he was born, he always been interested by space and the possible existence of an alien civilisation out of Earth. That's why during the whole last year, he built a hologram receptor in order to contact aliens. Yesterday evening, he achieved his invention and right after it began to sizzle. The sizzles became more and more clear until a perfect hologram appeared, representing an alien. During all the night, George spoke to the alien and learnt everything he could on his life and on his strange civilisation.

This next morning the boy was going to tell the whole story to his friends so that he was really excited. Arrived at school George began to speak to his friends "Guys, you're not going to believe me, but yesterday evening I spoke to aliens!". One friend replied "That's impossible, aliens don't exist! You're a liar!" George a little disappointed, continued "It's weird, I know but they explained to me their whole life and I'm sure they're existing! ". During twenty minutes, George tell the story of these strange aliens. He explained them that the aliens were some kind of jellyfishes living in a really distant planet from Earth. Indeed, their planet was located in the Large Magellanic cloud at 163 000 light years from us! It's such far from us that we can't never go there with the actual spaceships. Their planet called Jedha was constituted of a deep ocean composed by water and salt. The aliens were like jellyfishes so they were supposed to live less than half a year. Nevertheless, thanks to their advanced science and the use of robotic technologies, they can now live more than fifteen years.

George was really happy to explain that to his friends, but what he was the most interesting of was the daily life of the Jedha's habitants, so that he continued to debate about that. In the George's opinion the real advantage of these jellyfishes-aliens was that they haven't to sleep as often as us. They didn't loose one third of their life by doing nothing! At first glance, the day-to-day life of the aliens was similar to ours. Indeed, they have to eat, they breed, travel, communicate with others, go to school and then to work but they don't do these actions like us, not at all... Primary, these aliens have to eat all day long. Their main meal was algae joined by colourful sauces. That's why they created huge exploitations producing tons of algae. Furthermore, the concept of family wasn't existing in their civilisation. Each year, during the breeding season, each alien gave life to more than twenty little aliens. Just after give birth to them, they run away and regain their usual life. The kids won't ever know their parents and are raised in a huge building, which is a kind of school, until two years old. After those first two years of existence the aliens get a job and keep it until their death. The aliens didn't possess mouth and vocals cords so that, they were unable to speak. That's why they developed hologram technology to be able to communicate with others even if they were far away.

To conclude his long explanation, George said "That's it, I tell you the whole story. Their civilisation is such interesting that I could speak about it the whole day!". Unfortunately, the bells rang, and all the teens yelled "Stop George! You're nothing more than a liar!"
